ANTICIPY

Vibe your life.

The AI wearable that acts on what it hears.

omar@anticipy.ai

Anticipation Labs · Pre-seed · April 2026

Every wearable listens. Not one of them does anything about it.

Plaud makes $250M/year recording conversations. Nobody has built the part that does something about them. Until now.

It heard you. It's handled.

Insurance denial

Forty-seven minutes on hold. They deny the claim. You hang up, tell your partner you'll deal with it tomorrow — knowing you won't. It'll sit on your to-do list for weeks.

Anticipy caught the claim number, the denial reason, and the rep's name. Dispute filed before you set your phone down. Confirmation in your inbox before you pour your coffee.

Deadline moved

Your boss mentions Friday, not Monday, in a hallway conversation. You half-hear it. Nobody writes it down. Monday morning, three people show up with the wrong version.

Anticipy caught it the moment it was said. Calendar moved. Team notified. The meeting nobody wrote down still happened on time.

Meeting rescheduled

Your broker calls while you are at dinner. The viewing moved to Saturday morning. You nod, say thanks, hang up, and go back to your meal.

By the time dessert arrives, Anticipy has rescheduled your morning, confirmed with the broker, and sent you a reminder. You never touched your phone. You never even thought about it again.

They all record. None of them act.

Company	Records?	Transcribes?	Acts?	Cloud audio?	Status
Plaud — 1.5M users, $250M revenue	Yes	Yes	Does NOT act	Yes	Market leader (recording only)
Pocket — 30K+ units, $27M ARR	Yes	Yes	Does NOT act	Yes	YC W26. 50% MoM growth
Omi — 300K users, open-source	Yes	Yes	Does NOT act	Yes	$2.7M raised (Tim Draper)
Limitless — Records / memory	Yes	Yes	Does NOT act	Yes (acquired)	Acquired by Meta. Dec 2025
Bee — Records / reminders	Yes	Yes	Does NOT act	Yes (acquired)	Acquired by Amazon. Jul 2025
Halo — Records / AI apps	Yes	Yes	Acts on COMMAND only	Yes	Brilliant Labs. Funded.
Anticipy — Records, understands, acts	**Yes**	**Yes**	**Acts WITHOUT being asked**	**No — on-device only**	**Pre-seed. Action engine functional.**

Plaud does $250M/year just recording. Two recording companies were acquired by Meta and Amazon. OpenAI spent $6.5B to enter AI hardware with zero products shipped. The recording layer is a proven, billion-dollar category. The action layer — the part that actually does something — has never been built. We built it.

The assistant only rich people have.

$45,000–$150,000 a year. That's what a human personal assistant costs. Less than 1% of people will ever afford one.

$85B+	$48B	25%
wearable market	AI wearables	annual growth

OpenAI paid $6.5B for Jony Ive's AI hardware startup. Zero products shipped. Delayed to 2027. **Apple** is fast-tracking a recording pendant for 2027. It feeds data to Siri. It does not act. For **Apple** to build the autonomous action layer Anticipy already has, they would need to rebuild Siri from scratch. That is a 2029 problem at earliest. We launch Q4 2026. **Meta** acquired Limitless. **Amazon** acquired Bee. The giants are converging. We launch first.

Plaud alone does $250M/year selling a device that only records. The action layer is what we built. And it already works.

You put it on. You forget it's there.

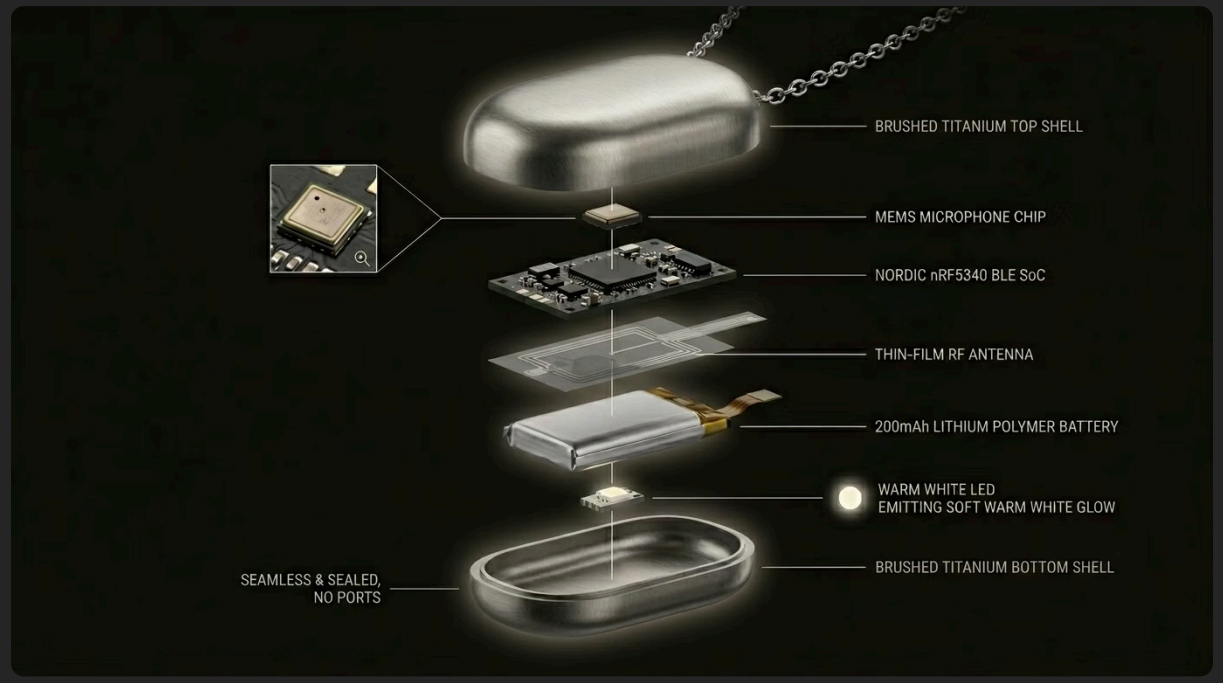
Lighter than two AirPods.

Brushed titanium. 8 grams. **Water-resistant**. Silver or gold. Smaller than an AirPod. Charges overnight, lasts for days.

It looks like jewelry. It works like the assistant you've always wanted.

Wireless overnight charging included. You never plug it in.

Charging base included in the box.



What's inside.

9 components. Pendant cost: $22. Full bundle cost: $50. 75% bundle margin at launch. Expanding to 90%+ at scale as volume drives component costs down.

In plain English

A microphone listens. A processor decides if something matters. If it does, a short text instruction goes to your phone. If it doesn't, the audio is gone in seconds. The pendant stores nothing. No recording is ever saved.

You sleep. It charges.

A charging base on your nightstand. Magnetic dock for overnight full charge. RF wireless power for room-scale ambient top-up throughout the day. FCC-approved technology. No cables. No contact required.

On base: full overnight charge. Within 5 feet: high-speed ambient charging. Up to 15 feet: continuous trickle charge. Multiple FCC-approved wireless power platforms are compatible — vendor partnerships in active discussion.

The charging base is included in every Anticipy bundle.

Ears. Brain. Hands.

1

Ears

Pendant captures speech, streams to your phone.

BLE audio streaming — the same proven technology in every wireless earbud.

2

Brain

Your phone converts speech to text, identifies intent, and discards audio within seconds. No recordings stored. Nothing leaves your device. Ever.

On-device speech-to-text and intent extraction — the core capability of every AI assistant, running locally.

3

Hands

Our action engine handles the rest — booking, canceling, scheduling, disputing. Every task runs to completion.

Autonomous browser and API execution — the capability **Amazon** acquired from Adept AI.

High-stakes actions confirm with you first. Everything else just happens.

The software runs today.

This is not a concept. The action engine already works.

Our AI agent has filed disputes, rescheduled meetings, canceled subscriptions, and booked restaurants. Autonomously. Core capabilities demonstrated and functional.

What the action engine has demonstrated:

- Insurance disputes filed autonomously
- Meetings rescheduled from overheard conversations
- Subscriptions canceled before charges hit
- Restaurant reservations booked from casual mentions
- Calendar conflicts resolved without user intervention

Privacy isn't a feature. It's the architecture.

How it works:

Encrypted Bluetooth

Audio streams to your phone via encrypted BLE.

On-device only

Your phone extracts intent and discards audio within seconds. No recording is ever stored.

Text only

Only a short text instruction reaches our servers. Never audio. Never a transcript.

No recording is ever stored. No audio ever leaves your phone.

Built for every jurisdiction:

US

One-party consent (38 states + D.C.). SB 1130 (pending). The wearer is always a party to the conversation — consent is inherent.

Canada / UK

One-party consent. Personal use legal.

EU

GDPR. Minimal exposure. On-device processing aligns with data protection by design.

Saudi Arabia / UAE / Singapore

Criminal penalties for unauthorized recording. On-device processing. Visible indicator LED. No persistent audio.

*When **Meta** acquired Limitless, they withdrew from the EU, UK, Brazil, and five other jurisdictions overnight rather than comply. Meta is now facing a class-action lawsuit over smart glasses privacy. Our architecture is designed for the hardest regulatory environments first — because we never store audio and never send audio to the cloud.*

$199. Everything included.

Personal assistant

$45,000/year

Anticipy

Less than a gym membership

$199 = pendant + charging base + chain + 12 months of service.

After year one: **$99/year.**

Bundle margin: **75% at launch** · Subscription margin: **90%+** · Blended margin at scale: **90%+**

Your $1.5M. Our trajectory.

	2027 Launch	2028 Scale	2029 Growth	2030 Expansion	2031 Dominance
Units sold	10,000	50,000	150,000	350,000	700,000
Hardware + base revenue	$1.99M	$9.95M	$29.85M	$69.65M	$139.30M
Subscription renewals	Included	$693K	$3.95M	$13.16M	$33.47M
Total revenue	$1.99M	$10.64M	$33.80M	$82.81M	$172.77M
Gross profit	$1.49M	$8.89M	$30.13M	$76.41M	$162.12M
BOM per bundle	$50	$34	$24	$18	$15
Gross margin	75%	84%	89%	92%	94%

The investment:

At $15M cap, $1.5M = 10% equity

Projected investor return:

2028: stake worth $8.5M (6x)

2031: stake worth $138M+ (92x)

At acquisition (comparable: Ring ~$1B, Nest $3.2B, io $6.5B pre-revenue): $35M to $173M+ (23x to 115x)

Year 6+ trajectory: $250M+ via international expansion, enterprise licensing, and action engine platform deals. BOM reduction driven by volume component pricing, tooling amortization, and Shenzhen manufacturing scale.

Based on 10,000 units at $199 + $99/yr renewals at 70% retention, scaling with manufacturing capacity and capital raises.

$1.5M to market.

September 2026
Working prototype complete

November 2026
Limited launch begins

Q1 2027
Scale production with revenue

Q2 2027
Seed raise $3–5M with traction data

Use of funds

- Team: firmware engineer, software engineer, head of growth, ops. 12 months runway. **$380K**
- Manufacturing: 10,000 units, charging bases, MIM tooling, Shenzhen sourcing. **$450K**
- Marketing, distribution, ad spend. **$150K**
- Legal, IP, certifications (FCC, CE, IC, provisional + PCT patent filings). **$80K**
- Operations, app development, infrastructure. **$140K**
- Working capital and contingency. **$300K**

Total: $1.5M

First hires: firmware engineer (Nordic nRF experience), full-stack developer, head of growth. Equity allocated. 12 months of funded runway.

Action engine available for licensing to AI platform companies. Additional B2B revenue from Year 2.

IP and defensibility.

Patent strategy

Provisional patents covering:

1. Ambient intent detection from natural conversation without explicit command
2. On-device ephemeral audio processing with sub-second deletion architecture

PCT international filing covering US, Canada, EU, UK, China, GCC, South Korea — filing upon close of raise. Patent budget allocated in use of funds.

The moat

- Privacy-first architecture creates a structural moat. Competitors that store or transmit audio cannot replicate our compliance posture.
- Action engine trained on months of real-world task completion data via Aevoy.
- First-mover in ambient action — competitors record, we act.
- **Apple** can build the hardware. **OpenAI** can build the model. Neither can replicate six months of production action engine data and the privacy architecture that makes it legal.
- What stops Plaud from adding action to their 1.5M users? They store and transmit audio to the cloud. Their architecture cannot support autonomous action without rebuilding from scratch. Our privacy-first architecture IS the action architecture.

Omar Ebrahim. 15. West Vancouver.

Started coding at 8. First production app at 13. At 15, built the AI that turns ambient conversations into completed tasks. Solo. Zero funding.

The software runs today. The action engine that every wearable company is trying to build already exists.

Legal and business infrastructure handled by family. Full focus on product and engineering.

> I'm just getting started.

Vibe your life.

Let's talk.

The AI wearable that acts on what it hears.
